Transmission Design Changes

First gear pinion stress: With the original face width of first gear being 1 inch.

The stresses were high. The width of the face was changed to 2 inch wide to make the stress acceptable

2nd gear pinion stresses:

The face of this gear was wider than it needed to be so the face got more narrow to .75 inches.

Almost making the stresses on 1st and 2nd pinions equal.

Gear ratios were also slightly changed with the output sprocket of the transmission losing a tooth and the input sprocket on the drive shaft gaining two teeth.

Drive System

- Rear Wheel Drive
- 1st Stage = Chain drive to a friction disc clutch
- 2nd stage = 1st gear or 2nd gear inside transmission
- 3rd stage 1.7:1 chain drive to drive shaft
- Differential to wheels 3.75:1

Gear Ratio and Drivetrain Specs

1. Chain drive ratio 1.73:1
2. 1st gear ratio 4:1
3. 2nd gear ratio 2:1
4. Transmission output chain to drive shaft 2.7:1
5. Differential to wheels 3.75:1

Overall Specs:

In 1st gear overall ratio is 69:1

In 2nd gear overall ratio is 34.4:1

1st gear speed of 7.5 mph @3200 rpm

2nd gear speed of 15 mph @3200 rpm

Engine output torque 14.7 ft lb@ 3200 Rpm

1. 25.3 ft lb
2. 101.2 ft lb
3. 50.6 ft lb
4. 270 ft lb and 135 ft lb
